

海平面

$W = B_L + B_R$ (水平投影)

B_L 测线位置 B_R

The diagram illustrates a seismic survey geometry. A horizontal blue line at the top represents the sea surface (海平面). Below it, a brown line represents the seabed (斜坡海底), which slopes upwards from left to right. A survey line is shown as a red triangle with its apex at a blue dot on the sea surface. The base of the triangle is on the seabed, with red dots at the endpoints. A vertical dashed line connects the apex to the seabed. The horizontal distance from the apex to the left endpoint is labeled B_L (green arrow), and to the right endpoint is B_R (green arrow). The total horizontal distance is $W = B_L + B_R$ (blue arrow). The angle between the vertical dashed line and the right side of the triangle is θ (red arc). The angle between the seabed and the left side of the triangle is α (brown arc). The vertical distance from the sea surface to the seabed along the dashed line is labeled $D(x)$ (grey arrow). Vertical dotted lines extend from the endpoints of the survey line to the sea surface.

$D(x)$
